Quarterly air quality report

Glebe Island / White Bay

Port Authority of New South Wales

October to December 2025

Summary

GHD Pty Ltd has been engaged by Port Authority of New South Wales to undertake air quality monitoring at Glebe Island and White Bay.

This quarterly air quality monitoring report presents a summary of the data collected by the Air Quality Monitoring Stations (AQMS) located at Glebe Island and Grafton Street for the period October to December 2025.

According to the Ambient Air Quality Standards set by the National Environment Protection Measure (NEPM) and the National Environment Protection Council (NEPC), there were no recorded exceedances for nitrogen dioxide (NO_2), or sulfur dioxide (SO_2) at the Glebe Island monitoring site. The measured concentrations for each of these pollutants remained well below the respective guideline criteria throughout the monitoring period.

There was one minor exceedance recorded for PM2.5 at both the Glebe Island and Grafton Street stations according to NEPM Ambient Air Quality Goals with a daily concentration of 25.6 ug/m^3 and 24.8 ug/m^3 respectively, compared to a daily concentration criteria of 20 ug/m^3. PM2.5 daily concentration were also recorded to be significantly elevated at other NSW AQMS including Cook & Phillip (31.5 ug/m^3) and Rozelle (25.8 ug/m^3) and are attributed to the regional ambient conditions. Therefore this minor recorded exceedance is not been attributed to any vessels.

The validated air quality monitoring report is provided by Acoem Australasia in Appendix A.

Executive Summary

The Port Authority of NSW has engaged Acoem Australasia (as a subcontractor to GHD Pty Ltd) to monitor ambient air quality at Glebe Island and White Bay. The monitoring stations measures key pollutants including $PM_{2.5}$, SO_2, NO_x and meteorological data in accordance with Australian Standards and NATA Requirements.

This report details results at the commissioned ambient air quality monitoring enclosure located at Glebe Island and Grafton Street for the quarter ending 31st December 2025.

Results Summary

- Percentage availability for all parameters measured at the Glebe Island station and Grafton Street station was above 95% for October 2025. Please refer to Table 23 and Table 26 for more details.

  Percentage availability for all parameters measured at the Glebe Island station and Grafton Street station was above 95% for November 2025. Please refer to Table 24 and Table 27 for more details.

- Percentage availability for all parameters measured at the Glebe Island station was above 95% for December 2025. Please refer to Table 25 for more details.

- Percentage availability for all parameters measured at the Grafton Street station was above 95% for December 2025 except for $PM_{2.5}$. Please refer to Table 28 for more details.

- There was one exceedance of $PM_{2.5}$ recorded at both Glebe Island and Grafton Street according to NEPM Ambient Air Quality Goals. Please refer to Table 15 to Table 20 for further information.

According to the Ambient Air Quality Standards and Goals set by the National Environment Protection Measure (NEPM) and the National Environment Protection Council (NEPC), there were two recorded exceedances for particulate matter ($PM_{2.5}$) and no recorded exceedances of nitrogen dioxide (NO_2), or sulfur dioxide (SO_2) at the Glebe Island monitoring site and the Grafton Street monitoring site. The measured concentrations for each of these pollutants remained well below the respective guideline criteria throughout the monitoring period. Please refer to Table 15 to Table 20 for further information.

1.0 Introduction

Port Authority of NSW has engaged Acoem Australasia (as a subcontractor to GHD Pty Ltd) to monitor ambient air quality at Glebe Island and White Bay, located as detailed in Table 1.

Acoem Australasia commenced data collection from the monitoring stations on the following respective dates:

1. Glebe Island on 13/01/2025.
2. Grafton station on 06/08/2025.

This report presents the available data for October - December 2025.

The data presented in this report:

- Describes air quality measurements;
- Compares monitoring results to air quality goals;
- Has been quality assured;
- Complies with NATA accreditation requirements, where applicable.

2.0 Monitoring and Data Collection

2.1. Siting Details

2.1.1. Station Location and Name

The Project monitoring network consists of two ambient air quality and weather monitoring stations. The station location and siting details are described below.

Table 1: Port Authority of NSW monitoring station locations

Site Name	Geographical Coordinates	Height Above Sea Level (m)
Glebe Island	33° 51’52.0’’S, 151°11’10.6’’E	2
Grafton Street	33°51'36.4"S 151°11'14.8"E	14

2.1.2. Siting Requirements

The project monitoring network stations are audited against the guidelines and mandatory requirements in the standards below, as relevant:

- A siting audit was conducted on the 18th of August 2025 to assess Glebe Island siting against the guidelines and mandatory requirements of *AS/NZS 3580.1.1:2016* [1] *and AS/NZS 3580.14:2014*[2].
- A siting audit was conducted on the 5th of September 2025 to assess Grafton Street siting against the guidelines and mandatory requirements of *AS/NZS 3580.1.1:2016*[1] *and AS/NZS 3580.14:2014*[2].

Audit results, including deviations from the guidelines, are detailed in Table 2 below. Any non-conformances with the mandatory requirements of the above standards are detailed in section 2.3.1.

2.2. Monitored Parameters

Table 3 below details the parameters monitored and the instruments used at the project monitoring stations. Appendix 1 defines any abbreviated parameter names used throughout the report.

- For meteorological sensors, the elevation given in the table below is the height above ground level at the monitoring station.
- For particulate parameters, the elevation given in the table below is the sample inlet height above ground level at the monitoring station.

2.3.1. NATA Endorsement and Conformance with Standards

Unless stated below, parameters are monitored at the project stations according to the stated methods detailed in Table 4 above.

- Measurement of wind data at both Glebe Island and Grafton Street does not comply with the requirements of AS/NZS 3580.14:2014 and is not covered by ACOEM's NATA scope of accreditation, in line with the site's monitoring agreement, as the sensor is installed at a height of 6m instead of 10m. In addition, the 2 yearly wind tunnel calibration at Glebe Island and Grafton Street has been overdue since 16/11/2025 and 15/11/2025 respectively.

- Measurement of $PM_{2.5}$, SO_2 and NO, NO_2 and NO_X at Glebe Island does not comply with the requirements of AS/NZS 3580.1.1:2016 due to interference within 10m from the instrument.

- Measurement of $PM_{2.5}$ at Grafton Street for the period from 15/12/2025 to 31/12/2025 does not fully comply with the requirement of AS/NZS 3580.9.12:2022 and is not covered by ACOEM'S NATE scope of accreditation due to flow calibration being incomplete since BAM unit re-installed on site since 15/12/2025. This calibration will be performed on the next possible opportunity.

2.3.2. Data Acquisition

Data acquisition is performed using a PC-based Congrego logger (using Congrego®) situated at each of the monitoring sites. The logger is equipped with a 4G modem for remote data collection. The recorded data is remotely collected from the Air Quality Monitoring Station (Congrego) loggers on a daily basis (using Airodis™ version 5.2) and stored at Acoem Australasia (Ecotech)'s Environmental Reporting Services (ERS) department in Melbourne, Australia. Data samples are logged in 5-minute intervals. Unless otherwise specified, raw data will be retained for at least four years.

2.4. Data Validation and Reporting

2.4.1. Validation

The Acoem Australasia ERS department performs daily data checks to ensure maximum data capture rates are maintained. Any equipment failures are communicated to the responsible field engineers for urgent rectification. Acoem Australasia ERS maintains two distinct databases containing non-validated and validated data respectively.

The validated database is created by duplicating the non-validated database and then flagging data affected by instrument faults, calibrations, and other maintenance activities. The data validation software requires the analyst to supply a valid reason (e.g. backed by maintenance notes, calibration sheets etc.) in the database for flagging any data as invalid.

Details of all invalid or missing data are recorded in the Valid Data Exception Tables.

Validation is performed by the analyst, and the validation is reviewed. Graphs and tables are generated based on the validated five minutes and one-hour data as appropriate.

When considering negative values recorded by the BAM instruments in accordance with the guidelines stated in AS/NZS 3580.9.12:2022: "*Occasionally BAMs may record short-term (<24 h) negative $PM_{2.5}$ concentrations. This is often associated with the loss of moisture or semi-volatile compounds in the collected particulate matter from the filter media that can occur during the measurement process. Short term negative values resulting from such loss should be considered to be real data and should not be invalidated from the dataset*".

2.4.2. Reporting

The reported data is provided in the Appendix 3 to this report which includes three tables as following:

1. 5-Minute Data
2. 1-Hour Data
3. 1-Day Data

The data contained in this report is based on Australian Eastern Standard Time. All averages are calculated from the five-minute and one-hour data.

Averages are based on a minimum of 75% valid readings within the averaging period. Where data capture is low for a particular parameter, summary values (e.g., monthly maximum and minimum) may be based on less than 75% valid samples. The reader should use caution when interpreting these values as they may not represent conditions for the entire sample period.

Averaging periods of eight hours or less are reported for the end of the period, i.e., the hourly average of 02:00 am is for the data collected from 1:00 am to 2:00 am. 1-hour averages are calculated based on a clock hour. 24-hour averages are calculated based on calendar days.

Automatic span, zero and background checks occur each night for continuously monitored gaseous parameters. Data associated with these checks is invalidated and is not specifically referred to in the valid data exception reports.

Table 5 displays the times for when these checks occur.

Table 5: Automatic Span / Zero and Background Checks at the monitoring stations

Station	Parameter	Span / Zero	Background
Glebe Island	NO / NO_2 / NO_x	01:00 – 01:35	n/a
	SO_2	01:00 – 01:35	22:45 – 22:55
Grafton Street	NO / NO_2 / NO_x	01:00 – 01:45	n/a
	SO_2	01:00 – 01:45	00:05 – 00:15

3.0 Air Quality Goals

The air quality standards and goals for pollutants monitored at the ambient monitoring sites are based on Australian National Environmental Protection (Ambient Air Quality) Measure (NEPM) for $PM_{2.5}$ and on Australian National Environmental Protection (Ambient Air Quality) Council (NEPC) for SO_2 and NO_2, which outlines stringent requirements for maintaining air quality within safe environmental standards. Detailed air quality objectives, including both short-term and long-term exposure limits, are presented in Table 6. These goals are meticulously designed to align with national air quality standards.

Table 6: Air Quality Goals[3]

Parameter	Time Period	Goal Level	Units
NO_2	1 hour	80	ppb
	1 Year	15	ppb
SO_2	1 hour	75	ppb
	1 day	20	ppb
$PM_{2.5}$	1 day	20	µg/m³
	1 year	7	µg/m³

Note:
This report will include all valid data points that exceed the defined air quality standards. The Ambient Air Quality NEPM includes a provision for excluding 1-day $PM_{2.5}$ averages associated with "exceptional events" from the total exceedances of the Air Quality standard. The definition of an "exceptional event" is included below for reference. It is the responsibility of the end-user of this data to evaluate whether any reported exceedances are associated with exceptional events and are eligible to be excluded from the exceedance total.

As per the Ambient Air Quality NEPM, *Exceptional event* means a fire or dust occurrence that adversely affects air quality at a particular location, and causes an exceedance of 1-day average standards in excess of normal historical fluctuations and background levels, and is directly related to bushfire; jurisdiction authorised hazard reduction burning; or continental scale windblown dust.

[3] The air quality criteria values listed in this document are based on the National Environment Protection Council (NEPC) standards as of 2025.

4.0 Calibration and Maintenance

4.1. Units and Uncertainties

The uncertainties for each parameter have been determined by the manufacturer's tolerance limits of the equipment's parameters, and by the data collection standard method.

The reported uncertainties are expanded uncertainties, calculated using coverage factors, which give a level of confidence of approximately 95%.

Table 7: Units and Uncertainties

Parameter	Units	Resolution	Uncertainty	Measurement Range[4]
NO, NO_2, NO_x (S40)	ppb	1 ppb	± (6% of reading + 0.011 ppm) k factor of 2.0	0 to 0.5 ppm LDL = 0.4 ppb
SO_2 (S50)	ppb	1 ppb	± (6% of reading + 11ppb) K factor of 2.0	0 to 500 ppb LDL = 0.3 ppb
$PM_{2.5}$ (BAM1020)	µg/m³	1 µg/m³	24Hr: ± (5.5% of reading + 4.0 µg/m³) (in range 0 - 100 µg/m³) Hr: ± (8% of reading + 8.0 µg/m³) k factor of 2.0	0 to 1000 µg/m³ LDL_{24hr} = 1.0 µg/m³ LDL_{hr} = 4.8 µg/m³
Vector Wind Speed	m/s	0.1 m/s	± 0.4 m/s or 2 % of reading, whichever is greater K factor of 2.0	0.01 to 30 m/s
Vector Wind Direction	deg	1 deg	± 4 deg K factor of 2.0	0 to 360 deg *Starting threshold:* 0.01 m/s
AT	˚C	0.1˚C	± 0.6˚C K factor of 2.0	-10°C to 50°C
RH	%	1%	± 6% RH K factor of 2.0	1 - 100%

[4] Uncertainties may not be calculated based on the full measurement range. The max measurement range for gas analysers is defined as the full scale (FS=Span/0.8).

4.2. Maintenance

4.2.1. Calibration & Maintenance Summary Tables

The last calibrations for the following parameters were performed on the indicated dates. Data supplied after this time is subject to further validation, to be performed at the next calibration cycle.

Note: Maintenance and calibration dates may differ, as calibrations may be less frequent than scheduled maintenance visits.

Table 8 to Table 13 indicate when the pollutant and meteorological equipment were last maintained/calibrated during October to December 2025.

[6] Spare BAM was removed from site on 15/12/2025.

[7] Original BAM unit was re-installed on site after repair on 15/12/2025.

[8] BAM background test was completed on 19/12/2025. Routine particle mass calibration is not required for installation of the instrument and will be perform in December 2026.

5.0 Results

5.1. Data Capture

Valid data capture refers to the amount of valid data collected during the reporting period. It is based on 5-minute data, for gaseous and meteorological parameters and 1-hour data for particulate parameters.

The percentage of valid data captured is calculated using the following equation:

Valid Data capture = (Reported air quality data / Total data) x 100%

Where:

- Reported air quality data = Number of samples (instrument readings) that have been validated through a quality-assured process and excludes all data errors, zero data collection due to calibration, equipment failures, and planned and unplanned maintenance.
- Total data = Total number of samples (instrument readings) expected for the sampling period. Total data is calculated based on the same averaging period as "reported air quality data" and the duration of the corresponding report period. e.g., for 5-minute data collected over a month of 31 days, the total data would be equal to 12 (5-minute samples in an hour) x 24 (hours in a day) x 31 (days in a month) = 8928 samples.

Table 14 below displays data capture statistics during October 2025 to December 2025. **Bold** values in the table indicate data capture below 95%.

Details of all invalid or missing data affecting data capture are included in the Valid Data Exception Tables, see section 6.0. All validated data are included in Appendix 3.

5.3. Monthly averages and annual averages

Table 21 and Table 22 display monthly averages of the $PM_{2.5}$, SO_2 and NO_2 parameters collected at Glebe Island and Grafton Street respectively. The averages shown are for the last 12 months, up to the current reported month. The table requires at least 75% valid data to display a monthly average. Footer values are based on all available data for past 12 months rather than the average of individual months. This gives an indication of performance against the annual objectives.

7.0 Result Summary

- Percentage availability for all parameters measured at the Glebe Island station and Grafton Street station was above 95% for October 2025. Please refer to Table 23 and Table 26 for more details.
- Percentage availability for all parameters measured at the Glebe Island station and Grafton Street station was above 95% for November 2025. Please refer to Table 24 and Table 27 for more details.
- Percentage availability for all parameters measured at the Glebe Island station was above 95% for December 2025. Please refer to Table 25 for more details.
- Percentage availability for all parameters measured at the Grafton Street station was above 95% for December 2025 except for $PM_{2.5}$. Please refer to Table 28 for more details.
- There was one exceedance of $PM_{2.5}$ recorded at both Glebe Island and Grafton Street according to NEPM Ambient Air Quality Goals. Please refer to Table 15 to Table 20 for further information.

Appendix 1 - Definitions & Abbreviations

°	Degrees (True North)
µg/m³	Micrograms per cubic metre at standard temperature and pressure (0°C and 101.3 kPa)
AT	Ambient Temperature
BAM	Beta Attenuation Monitors
calm	Wind conditions where the wind speed is below the operating range of the wind sensor
ERS	Environmental Reporting Services
NO	Nitric Oxide
NO_2	Nitrogen dioxide
NO_x	Oxides of nitrogen
$PM_{2.5}$	Particulate less than 2.5 microns in equivalent aerodynamic diameter
ppb	Parts per billion
RH	Relative Humidity
Sigma	Sigma Theta is the standard deviation of the horizontal wind direction fluctuations over the averaging period.
SO_2	Sulphur dioxide
WD	Vector Wind Direction
WS	Vector Wind Speed

Appendix 2 - Explanation of Exception Table

Automatic filter tape advance refers to the movement of the filter paper by the analyser to an un-used spot.

Automatic background check refers to when analyser samples zero air and measures the level of the concentration voltage. This voltage is taken as the zero signal level and this value is subtracted from any subsequent readings as an active zero compensation. This is the analyser's fine zero measurement.

Automatic span/zero check. The E-Sampler is programmed to perform a zero calibration check whereby air is passed through filter element, removing particulates, before entering the sensor in the analyser. Data is invalidated when these checks occur.

Beta count failure refers to a fault in the functioning of the EBAM. A one minute beta count was less than the maximum acceptable counts during operation.

Calibration check outside tolerance refers to when the calibration values are outside the tolerance limits set for the precision check.

Calibration correction factor applied to data refers to an offset or multiplier applied to the data. This operation may be performed for a number of reasons including: (a) when a clear trend / drift outside the tolerance limit can be demonstrated by repeated operation precision checks, (b) when a correction is required on previously logged data due to a calibration check being outside the allowable tolerance

Commissioning refers to the initial setup and calibration of the instrument when it is first installed. For some instruments there may be a stabilisation period before normal operation commences.

Data transmission error refers to a period of time when the instrument could not transmit data. This may be due to interference, or a problem with the phone line or modem.

Equipment malfunction/instrument fault refers to a period of time when the instrument was not in the normal operating mode and did not measure a representative value of the existing conditions.

Gap in data/data not available refers to a period of time when either data has been lost or could not be collected.

Instrument Alarm refers to an alarm produced by the instrument. A range of alarms can be produced depending on how operation of the instrument is being affected.

Instrument out of service refers to a lack of data due to an instrument being shut down for repair, maintenance, or factory calibration.

Linear offset or multiplier refers to when an offset or multiplier has been applied between two points where the values of the offset or multiplier are different and the correction is interpolated between the two points.

Logger error refers to when an error occurs and instrument readings are not correctly recorded by the logger.

Maintenance refers to a period of time when the logger/instrument was switched off due to maintenance.

Overnight span/zero out of tolerance refers to when the span/zero reading measured by the analyser during an automatic precision check falls outside of the expected concentration limits.

Overnight zero out of tolerance refers to when the automatic zero reading measured by the analyser falls outside the expected limits.

Power Interruption refers to no power to the station therefore no data was collected at this time.

Remote Calibration refers to when a technician remotely connects to the station and manually performs a span check.

Static offset or multiplier refers to when a single offset or multiplier has been applied to the data between two points either to increase or decrease the measured value.

Tape break refers to the breaking of the EBAM/BAM sample tape during operation.

Warm up after power interruption refers to the startup period of an instrument after power has been restored.
